Medical Certificate

Re: Giotta Paul, Bruehlgartenstr. 31, 8400 Winterthur, Switzerland
Born on 26.06.1964, Ph. Private: +41-52 202 6913

Dear Sir or Madam

Hereby it is confirmed that Mr. Giotta suffers from a grave illness. The further progression is uncertain, Mr. Giotta's further life expectancy is clearly limited under these circumstances.

Kind regards,

Dr. med. Th. Eugster

APPLICANTS : Barry J. Gilhuly et al.
TITLE : System and Method for Pushing
Information from a Host System
to a Mobile Data Communication
Device
SERIAL NO. : 09/401,868
FILING DATE : September 23, 1999
EXAMINER : Edelman, Bradley E.
GROUP ART UNIT : 2153
ATTORNEY DOCKET NO. : 555255012109

Second Amendment

Commissioner for Patents
P.O. Box 1450
Alexandria, VA 22313-1450

Sir:

This Amendment responds to a phone conference between the Examiner and applicants Attorney which took place on August 26, 2003. Any fees due for filing this Amendment are authorized to be charged to Jones Day Deposit Account No. 501432, ref: 555255012109.

Amendments to the Specification

Please change the title of the application as follows:

System and method for pushing information from a host system to a mobile data communication device transmitting messages originating from a wireless device

Please amend the abstract as follows:

A system and method for pushing information from a host system to a mobile data communication device upon sensing a triggering event is disclosed. A redirector program operating at the host system enables a user to continuously redirect certain user-selected data items from the host system to the user's mobile data communication device upon detecting that one or more user-defined triggering events has occurred. The redirector program operates in connection with event-generating applications and repackaging systems at the host system to configure and detect a particular user-defined event, and then to repackage the user-selected data items in an electronic wrapper prior to pushing the data items to the mobile device. The mobile data communication device may originate new messages or reply messages to previously received information, such messages being transmitted to a wireless redirector host system, which then transmits a copy of the messages to both the intended recipient and a first electronic mail account associated with the mobile data communication device.

Amendments to the Claims

55. (Currently Amended) A method of transmitting electronic mail messages from a message sender to a message recipient having a wireless mobile data communication device, and of transmitting reply messages from the message recipient to the message sender, comprising the steps of:

(A) addressing an original electronic mail message to a first electronic mail account associated with the message recipient, wherein the first electronic mail account is a memory store associated with a messaging host system coupled to a wide area wired network;

(B) transmitting the original electronic mail message to the messaging server host system and storing the original electronic mail message in the first electronic mail account;

(C) generating a copy of the original electronic mail message, wherein the copy is addressed to a second electronic mail account associated with the wireless mobile data communication device;

(D) forwarding the copy to a wireless redirector host system via the wide area wired network coupling the messaging host system to the wireless redirector host system, wherein the original electronic mail message remains stored in the first electronic mail account;

(E) storing the copy in the second electronic mail account associated with the wireless mobile data communication device;

(F) detecting the copy in the second electronic mail account and transmitting the copy from the wireless redirector host system to the message recipients' wireless mobile data communication device via a wide area wireless network;

(G) generating a reply message to the copy at the wireless mobile data communication device and transmitting the reply message to the wireless redirector host system;

(H) preparing two copies of the reply message at the wireless redirector host system and addressing a first copy of the reply message to the message sender and addressing a second copy of the reply message to the first electronic mail account; and

(I) transmitting the first copy of the reply message to the message sender via the wide area wired network and transmitting the second copy of the reply message to the messaging host server via the wide area wired network.

56. (Currently Amended) The method of claim 55, further comprising the steps of:

(J) storing the second copy of the reply message in the first electronic mail account; and

(K) determining that the second copy of the reply message is not an original message addressed to the first electronic mail account and preventing the forwarding of the second copy of the reply message from the messaging host system to the wireless redirector host system.

57. (Currently Amended) The method of claim 55, further comprising the steps of:
prior to transmitting the first copy of the reply message to the message sender, (J)
configuring addressing information of the first copy so that the first copy of the reply
message is addressed as originating from the first electronic mail account associated with
the messaging host system.

58. (Currently Amended) The method of claim 55, further comprising the steps of:
(J) accessing the first electronic mail account via a computer coupled to the
messaging host system via the wide area wired network;
(K) generating a reply message to the original electronic mail message stored in
the first electronic mail account; and
(L) transmitting the reply message to the message sender.

59. (Cancelled)

60. (Currently Amended) A method of transmitting messages originating from a wireless
device associated with a first electronic mail account maintained at a messaging host
system, comprising the steps of:

(A) generating an original message at the wireless device, wherein the original
message is addressed to a message recipient;
(B) transmitting the original message from the wireless device to a wireless
redirector host system via a wireless network;

- (C) receiving the original message at the wireless redirector host system and preparing two copies of the original message, a first copy addressed to the message recipient, and a second copy addressed to the first electronic mail account maintained at the messaging host system, wherein the first copy is addressed as originating from the first electronic mail account and the second copy is addressed as originating from the wireless device; and
- (D) transmitting the first copy from the wireless redirector host system to the message recipient and transmitting the second copy from the wireless redirector host system to the messaging host system where the second copy is stored in the first electronic mail account.

61. (Currently Amended) The method of claim 60, further comprising the steps of:

- (E) placing the original message in an electronic envelope addressed to a second electronic mail account maintained at the wireless redirector host system;
- (F) transmitting the electronic envelope from the wireless device to the wireless redirector host system and storing the electronic envelope in the second electronic mail account; and
- (G) detecting the electronic envelope in the second electronic mail account at the wireless redirector host system and retrieving the original message from the electronic envelope.

62: (Currently Amended) The method of claim 60, further comprising the steps of:

- (E) detecting the second copy stored in the first electronic mail account;

(F) determining that the second copy is a message originating from the wireless device; and

(G) preventing the messaging host system from forwarding the second copy back to the wireless redirector host system.

63. (Cancelled)

64. (New) The method of claim 60, further comprising the steps of:

receiving a message at the first electronic mail account from an external source;
detecting the message in the first electronic mail account;
forwarding a copy of the message to the wireless redirector host system;
determining whether the message should be redirected from the wireless redirector host system to the wireless device; and
if the message should be redirected, then packaging the message into an electronic envelope and transmitting the electronic envelope to the wireless device.

65. (New) The method of claim 64, wherein the detecting step includes the steps of:

determining whether a new message has been received at the first electronic mail account; and
checking a forwarding file coupled to the messaging host system to determine whether to redirect the new message to the wireless redirector host system.

66. (New) The method of claim 65, wherein the forwarding file includes a list of system addresses where the new message should be forwarded by the messaging host system.

67. (New) The method of claim 60, further comprising the steps of:

configuring a set of filtering rules for use by the wireless redirector host system in determining whether messages should be redirected; and

providing an access mechanism that allows a user of the wireless device to remotely configure and reconfigure the filtering rules.

68. (New) The method of claim 60, further comprising the steps of:

configuring a user profile database for use by the wireless redirector host system in determining whether messages should be redirected; and

providing an access mechanism that allows a system administrator of the messaging host system to remotely configure and reconfigure the user profile database.

69. (New) The method of claim 64, further comprising the steps of:

receiving the electronic envelope at the wireless device;

extracting the message from the electronic envelope; and

storing the message within the memory of the wireless device.

70. (New) The method of claim 60, wherein the messages are E-mail messages, and the messaging host system is an E-mail host system.

71. (New) The method of claim 60, wherein the wireless device is a laptop computer.

72. (New) The method of claim 60, wherein the wireless device is a two-way paging computer.

73. (New) The method of claim 72, wherein the two-way paging computer includes a wireless network interface for communicating with the wireless redirector host system via a wireless data network.

74. (New) The method of claim 73, wherein the wireless redirector host system is coupled to the wireless data network via a wireless gateway system.

75. (New) The method of claim 60, wherein the wireless device is a capable of voice and data communications.

76. (New) The method of claim 60, wherein the messaging host system is an Internet Service Provider.

77. (New) The method of claim 76, wherein the messages are E-mail messages, and the Internet Service Provider includes a mail server program.

78. (New) The method of claim 77, wherein the Internet Service Provider further includes a forwarding database coupled to the mail server program for detecting whether a new message received at the mail server should be forwarded to a wireless redirector host system, and for determining the electronic address of that wireless redirector host system.

79. (New) The method of claim 60, wherein the messaging host system and the wireless redirector host system are coupled via the Internet.

80. (New) The method of claim 67, wherein the access mechanism for remotely configuring and reconfiguring the filtering rules is a web-page interface.

81. (New) The method of claim 68, wherein the access mechanism for remotely configuring and reconfiguring the user profile database is a web-page interface.

82. (New) The method of claim 60, further comprising the steps of:

detecting a message for the user of the wireless device at the messaging host system;

forwarding a copy of the message from the messaging host system to the wireless redirector host system;

receiving the forwarded message at the wireless redirector host system and applying a set of user-defined filtering rules that determine whether or not to redirect the message to the user's wireless device via a wireless network coupled to the wireless redirector host system; and

if the filtering rules determine that the message is of the type that should be redirected, then redirecting the message to the user's wireless device by packaging the message in an electronic envelope that includes the wireless network address of the user's wireless device.

83. (New) The method of claim 82, further comprising the steps of:

providing a filter rules database for storing the user-defined filter rules; and
providing an interface mechanism to the filter rules database through which the user may define and re-define the filtering rules.

84. (New) The method of claim 83, wherein the interface mechanism is a web page interface.

85. (New) The method of claim 84, wherein the web page interface includes an activation/deactivation switch for turning on/off the operation of the wireless redirector host system for a particular user.

86. (New) The method of claim 60, wherein the original message is a reply message to a message received at the wireless device from the message recipient.

87. (New) The method of claim 60, wherein the step of transmitting the original message from the wireless device to a wireless redirector host system further comprises the steps of:

transmitting the original message from the wireless device to a wireless gateway via the wireless network; and

transmitting the original message from the wireless gateway to the wireless redirector host system.

88. (New) The method of claim 60, wherein the messaging host system is a web-based E-mail hosting service.

89. (New) A system for transmitting messages, comprising:

a wireless device for originating a message addressed to a message recipient, wherein the wireless device is associated with a first electronic mail account maintained at a messaging host system; and

a wireless redirector host system for receiving the originated message via a wireless network from the wireless device, wherein the wireless redirector host system prepares two copies of the originated message, a first copy addressed to the message recipient, and a second copy addressed to the first electronic mail account maintained at the messaging host system, wherein the first copy is addressed as originating from the first electronic mail account and the second copy is addressed as originating from the wireless device; and

wherein the wireless redirector host system transmits the first copy to the message recipient and transmits the second copy to the messaging host system where the second copy is stored in the first electronic mail account.

90. (New) The system of claim 89,

wherein the wireless device places the originating message in an electronic envelope addressed to a second electronic mail account maintained at the wireless redirector host system and transmits the electronic envelope to the wireless redirector host system, the electronic envelope being stored in the second electronic mail account; and

wherein the wireless redirector host system detects the electronic envelope in the second electronic mail account and retrieves the originating message from the electronic envelope.

91. (New) The system of claim 89, wherein the messaging host system detects the second copy stored in the first electronic mail account, determines that the second copy is a message originating from the wireless device, and is prevented from forwarding the second copy back to the wireless device.

92. (New) The system of claim 89, further comprising:

an external source which transmits a message to the first electronic mail account; the messaging host server detecting the message in the first electronic mail account and forwarding a copy of the message to the wireless redirector host system;

the wireless redirector host system determining whether the message should be redirected to the wireless device, and if the message should be redirected, then packaging the message into an electronic envelope and transmitting the electronic envelope to the wireless device.

93. (New) The system of claim 92, wherein the messaging host system determines whether a new message has been received at the first electronic mail account and checks a forwarding file coupled to the messaging host system to determine whether to redirect the new message to the wireless redirector host system.

94. (New) The system of claim 93, wherein the forwarding file includes a list of system addresses where the new message should be forwarded by the messaging host system.

95. (New) The system of claim 89, further comprising:

a set of filtering rules configured for use by the wireless redirector host system in determining whether messages should be redirected; and
an access mechanism that allows a user of the wireless device to remotely configure and reconfigure the filtering rules.

96. (New) The system of claim 89, further comprising:

a user profile database configured for use by the wireless redirector host system in determining whether messages should be redirected; and

an access mechanism that allows a system administrator of the messaging host system to remotely configure and reconfigure the user profile database.

97. (New) The system of claim 89, wherein the messages are E-mail messages, and the messaging host system is an E-mail host system.

98. (New) The system of claim 89, wherein the wireless device is a laptop computer.

99. (New) The system of claim 89, wherein the wireless device is a two-way paging computer.

100. (New) The system of claim 99, wherein the two-way paging computer includes a wireless network interface for communicating with the wireless redirector host system via a wireless data network.

101. (New) The system of claim 100, wherein the wireless redirector host system is coupled to the wireless data network via a wireless gateway system.

102. (New) The system of claim 89, wherein the wireless device is a capable of voice and data communications.

103. (New) The system of claim 89, wherein the messaging host system is an Internet Service Provider.

104. (New) The system of claim 103, wherein the messages are E-mail messages, and the Internet Service Provider includes a mail server program.

105. (New) The system of claim 104, wherein the Internet Service Provider further includes a forwarding database coupled to the mail server program for detecting whether a new message received at the mail server should be forwarded to a wireless redirector host system, and for determining the electronic address of that wireless redirector host system.

106. (New) The system of claim 89, wherein the messaging host system and the wireless redirector host system are coupled via the Internet.

107. (New) The system of claim 95, wherein the access mechanism for remotely configuring and reconfiguring the filtering rules is a web-page interface.

108. (New) The system of claim 96, wherein the access mechanism for remotely configuring and reconfiguring the user profile database is a web-page interface.

109. (New) The system of claim 89,
wherein the messaging host system detects a message for the user of the wireless device and forwards a copy of the message to the wireless redirector host system;

wherein the wireless redirector host system receives the forwarded message and applying a set of user-defined filtering rules that determine whether or not to redirect the message to the user's wireless device via a wireless network coupled to the wireless redirector host system, and if the filtering rules determine that the message is of the type that should be redirected, then the wireless redirector host system redirects the message to the user's wireless device by packaging the message in an electronic envelope that includes the wireless network address of the user's wireless device.

110. (New) The system of claim 109, further comprising:

a filter rules database for storing the user-defined filter rules; and
an interface mechanism to the filter rules database through which the user may define and re-define the filtering rules.

111. (New) The system of claim 110, wherein the interface mechanism is a web page interface.

112. (New) The system of claim 111, wherein the web page interface includes an activation/deactivation switch for turning on/off the operation of the wireless redirector host system for a particular user.

113. (New) The system of claim 89, wherein the originating message is a reply message to a message received at the wireless device from the message recipient.

114. (New) The system of claim 89, wherein the messaging host system is a web-based
E-mail hosting service.

Remarks

This Amendment responds to the telephone conference between the Examiner and applicant's attorney. In this phone conference, the Examiner indicated that claims 55-58 and 60-62 were in condition for allowance, with the exception of a minor typographical error in claim 55. Claim 55 has now been amended to correct this error and claims 59 and 63 have been cancelled. Therefore, claims 55-58 and 60-62 are allowable.

New claims 64-88 depend from claim 60 and thus are in condition for allowance.

New claims 89-114 are system claims that correspond to method claims 64-88 and thus are in condition for allowance.

Respectfully submitted,

(54) Title: COMMUNICATION SYSTEM INCLUDING MEANS FOR TRANSMITTING INTERNET ADDRESSES VIA SMS

(57) Abstract

The invention provides a communication system, adapted to establish connections to, and between, Internet users, including a cellular radio communication network adapted to provide a short message service (SMS), and a server adapted to facilitate the establishment of a telephony/Internet connection between a mobile subscriber station of said network and an Internet user. SMS is used to transfer, from the mobile subscriber station to the server, information identifying the Internet address for the Internet user and, from the server to the mobile subscriber station, information relating to the required connection between the mobile subscriber station and the Internet user.

Abstract (English translation)

Published Patent Application DE 199 61 345 A1 (Robert Bosch GmbH)

Method for transmission of electronic postal messages

Proposed is a method for the transmission of electronic postal messages (1) that primarily consumes not a lot of data capacity. In doing so, a short-message-service is used, whereby with a short-message (5) in a first communications network (100) an electronic postal message (1) as well as address- and/or identification-data to be used for the transmission of the electronic postal message (1) in a second communications network (200) are transmitted. Together with the short message (5) a first header information (11) is transmitted including signaling information for at least one data field (20, 25, 30, 35), comprising address- and/or identification-data. Together with the short message (5) a second header information (12) is transmitted, pointing to existing first header information (11). The at least one data field (20, 25, 30, 35) is transmitted within a data-portion (50) of the short message (5) outside any header information.

Die folgenden Angaben sind den vom Anmelder eingereichten Unterlagen entnommen

⑰ Verfahren zur Übertragung von elektronischen Postnachrichten

⑱ Es wird ein Verfahren zur Übertragung von elektronischen Postnachrichten (1) vorgeschlagen, das möglichst wenig Datenkapazität beansprucht. Dabei wird ein Kurznachrichtendienst verwendet, wobei mit einer Kurznachricht (5) in einem ersten Kommunikationsnetz (100) eine elektronische Postnachricht (1) sowie Adress- und/oder Identifikationsdaten für die Übertragung der elektronischen Postnachricht (1) in einem zweiten Kommunikationsnetz (200) übertragen werden. Mit der Kurznachricht (5) wird eine erste Kopfinformation (11) mit einer Signalisierung mindestens eines Datenfeldes (20, 26, 30, 35) übertragen, das die Adress- und/oder Identifikationsdaten umfasst. Mit der Kurznachricht (5) wird eine zweite Kopfinformation (12) übertragen, die auf das Vorhandensein der ersten Kopfinformation (11) hinweist. Das mindestens eine Datenfeld (20, 26, 30, 35) wird innerhalb eines Datenteils (50) der Kurznachricht (5) außerhalb jeder Kopfinformation übertragen.

(54) Title: A SYSTEM AND METHOD FOR SENDING MULTIMEDIA ATTACHMENTS TO TEXT MESSAGES IN RADIO-COMMUNICATION SYSTEMS

WO 01/13656 A1

(57) Abstract: Methods and systems for transmitting attachments to text messages without turning terminals into e-mail clients are described. When an attachment is to be transmitted, an address of an attachment server is appended to the text message. The text message is then forwarded to the intended recipient, e.g., via an SMS server, while the attachment is sent to the attachment server. Upon receipt of the text message, the recipient can then download the attachment from the attachment server using the address included in the text message.

(54) Title: DATA TRANSMISSION METHOD AND APPARATUS

WO 01/41472 A1

(57) Abstract: The present invention relates to a data transmission method and apparatus for performing a data transmission between end terminals of a telecommunication network, particularly a data transmission between an origin server and a mobile client. The data is transmitted from at least one of the end terminals using the first data bearer. Then, data transmission is switched from the first to the second data bearer, if a predetermined bearer need condition has been determined or in order to obtain a subscriber identity used for gathering charging data. Thereby, the network service provided by the operator can be improved, since the bearer switching allows an increase of the overall speed of the data transmission, an adaptation of the bearer bandwidth to the data amount, and a provision of the subscriber identity. The first data bearer may be a USSD or SMS data bearer, and the second data bearer may be a circuit-switched data bearer or a GPRS bearer, or vice versa.

(54) Title: METHOD AND APPARATUS FOR MAPPING AN IP ADDRESS TO AN MSISDN NUMBER WITHIN A WIRELESS APPLICATION PROCESSING NETWORK

WO 01/67716 A1

(57) Abstract: A system and method for associating an MSISDN of a mobile terminal (45) with a temporarily assigned IP address is disclosed. A first server (60) located within a wireless communications network generates and transmits a start packet to a WAP network (10) responsive to an access request by a mobile terminal (45). The start packet includes the MSISDN of the mobile terminal (45) and an assigned IP address. A second server (70) within the WAP network (10) extracts the MSISDN in the IP address from the received start packet and stores this information together within a database (80). When a WAP application (85) is utilized, the database (80) may be periodically updated based upon changes between the association of the MSISDN and the assigned IP address. This process may be used for a number of things within a network including authentication, billing and personalization.
